96

97 **Executive Summary**

98

99 This document serves as a plan and schedule for activity conducted by the CORBAMED ,
100 the OMG's Healthcare Domain Task Force.

101

102 There are four focus areas of group effort:

103

- 104 • **Requirement Elaboration:** activity which increases the Task Force's level of
105 awareness of industry requirements. An example is issuing a Request for Information
106 (RFI) and attendant response evaluations.
- 107 • **Specification Development:** activity which results in the specification and
108 adoption of standard object interfaces for healthcare domain components. An
109 example is issuing a Request for Proposal (RFP) and attendant response evaluations.
- 110 • **Healthcare Reference Object Model Development:** activity which defines a
111 reference model for healthcare domain software components, possibly utilizing the
112 enterprise view of the RM-ODP. Once developed, it will guide the specification
113 developments.
- 114 • **OMG Support:** activity which ensures consistency with, and support of, healthcare
115 domain requirements by existing OMG specifications. An example is active
116 participation in OMG Platform Technical Committee task forces.

117

118

119 Listed below are some of the significant activities undertaken thus far:

120

- 121 • Issuance of several RFIs to gather information of worldwide activities to guide the
122 direction of the task force's efforts and advice in the on issuance of a RFP (or RFPs).
- 123 • Issuance of an RFP for a Person Identification Service (PIDS)
- 124 • Issuance of an RFP for a Lexicon Query service (CORBAlex)
- 125 • Issuance of an RFP for a Pharmacy Interaction Facility (PIF)
- 126 • Issuance of an RFP for a Clinical Observation Access Service (COAS)

127

128

129 Amongst others, topics for future specification development include Legacy Wrapping,
130 M to IDL mapping, Healthcare Security Framework, Clinical Encounter Management,
131 Clinical Order Services or Frameworks, and Clinical Resource Scheduling

132

133

134 **1.0 INTRODUCTION**

135

136 **1.1. Intended audience**

137

138 There exists a need to communicate the activities of the CORBAmed DTF to a variety of
139 groups of individuals. These groups include OMG members who are not active
140 participants within CORBAmed, new members to CORBAmed, and also existing
141 members of CORBAmed. It is becoming more and more difficult to remain current on
142 all activities as the group is growing at such a rapid pace. We therefore will create a
143 working document to communicate past and current activities as well as to provide
144 guidance for our future activities.

145

146 The roadmap metaphor can thereby describe the locations that we have visited and our
147 final destination, including the path and stops we must traverse along the way.

148

149 **1.2. Purpose of the CORBAmed Roadmap**

150

151 The purpose of the CORBAmed Roadmap is to allow for creating OMG deliverables,
152 interoperability specifications within the Healthcare domain, while creating an overall
153 comprehensive domain architecture. One of the goals of the roadmap is to allow for
154 immediate significant achievements by CORBAmed by clearly defining the scope,
155 boundaries and relationship within one or more sub-sections of the vast domain of
156 healthcare.

157

158 This document serves as a plan and schedule for the activities related to creating OMG
159 specifications within healthcare. The roadmap includes the work currently initiated and
160 expected to commence within the next 36 months. The roadmap is a working document
161 and will be updated upon the initiation of CORBAmed activities not anticipated at the
162 onset. It identifies categories of activity and specific work items within those categories,
163 lists expected work item deliverables; and provides a schedule for work items. Hence,
164 this document will serve the purpose of guiding as well as describing the CORBAmed
165 activities.

166

167 Much of what is contained in this document exists in the minds of those who participate
168 in CORBAmed DTF activities. The purpose of this inclusion is to provide
169 communication to those expressing an interest. This can be seen in the following
170 sections: requirements elaboration and specification development. A point should be
171 made that sections of this document introduce new areas which need to be addressed by
172 the CORBAmed DTF, including a healthcare reference object model which is crucial to
173 insure that DTF specifications not only provide a solution for a target area but that they
174 also fit into the architecture for previous and future specifications.

175

176 **1.3. Short vs Long Term Roadmap**

177

178 The debate of the role and existence of domain architecture(s) within the OMG has been
179 widely discussed. There are a great deal of OMG and ISO activity in exploring an
180 appropriate methodology and model for describing such architectures. It is certain that
181 CORBAMED as a vertical domain within the OMG will be given some directives on how
182 to describe its architecture. It is also certain that the many excellent efforts within the
183 healthcare field and other related efforts within the OMG, including its vertical domains,
184 will directly drive the input for such domain architecture, as the role of CORBAMED is to
185 create open standardized CORBA interfaces. The initiative of producing specifications
186 will ultimately be driven by the CORBAMED healthcare reference object model.

187

188 The enterprise view of the Reference Model – Open Distributed Processing (RM-ODP) is
189 being discussed and presented as a likely and appropriate candidate methodology to
190 describe a domain architecture.

191

192 •

193

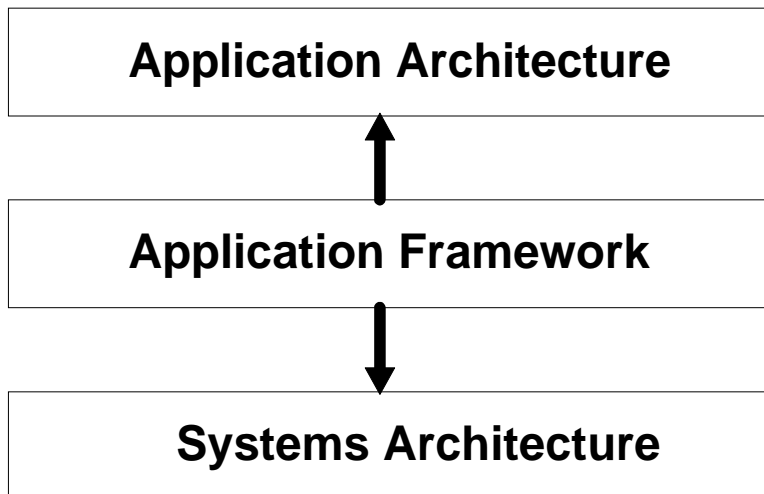

194 **1.4. Architectural Vision**

195

196 The Manufacturing Domain Task Force proposes a high-level architecture for object-
197 oriented manufacturing systems that is equally representative for healthcare. While very
198 abstract in nature, it none the less establishes the context for identifying work areas for
199 the group. Figure 1 depicts that model.

200

201

202

203

204 **Figure 1. Proposed Top-Level Architecture for Object-Oriented Manufacturing**
205 **Systems.**

206 The first component, the *Application Architecture*, is a model of the business policy and
207 processes that a system is intended to carry out. The second component is the *Application*
208 *Framework*, which is a reusable, domain-specific design and the implementation of that
209 design. The third component is a model of the automation mechanism, the *Systems*
210 *Architecture*. Relating Figure 1 to *the Object Management Architecture (OMA)* the
211 system architecture block corresponds to the platform specific infrastructure elements
212 (e.g. operating system) as well as the *Object Request Broker*, *Object Services* and
213 *Common Facilities*. The Application Framework block corresponds to the Domain
214 Interfaces and the Application Architecture block corresponds to *Application Interfaces*.

215

216 It is this architectural vision that serves as a guideline to the activities defined within this
217 roadmap.

218

219

220 **2.0 BACKGROUND**221 **2.1. The State Of Healthcare Informatics.**

222

223 The use of automation in healthcare began in the late 1960's with the advent of Hospital
224 Information Systems (HIS). The original HIS' were mainframe based information
225 systems and supported billing. Other administrative functions (admission-discharge-
226 transfer of patients, inventory, scheduling) were added with time. The availability of
227 lower cost minicomputers in the 1970's spurred the introduction of departmental
228 information systems (radiology information system, lab information system, pharmacy
229 management system, etc.). These systems supported similar administrative and workflow
230 tracking functions at the clinical departmental level. The mainframe-based HIS systems
231 tried to respond by adding departmental modules, but the special clinical requirements of
232 individual departments hindered this (at least until the early 1990s when acquisitions
233 resulted in a few companies with domain expertise across the hospital's departments.
234 However, ambulatory care remains an informatics specialty largely unto itself to this
235 day). The result has been a "tower of babel" situation where most information systems
236 within a hospital or IDS cannot interoperate. The HL-7 standard was created to allow
237 these systems to *communicate*, but even in its current (third) iteration, the HL-7 standard
238 has had virtually no effect on healthcare systems interoperability.

239

240 The 1980's saw the rise of relational database management systems and client server
241 computing. Many businesses made major investments in converting to these
242 technologies. However, healthcare has been slow to respond. The reasons for this can
243 only be speculated upon, but it has been noted that healthcare institutions typically spend
244 a far lower percentage of their operating budgets on informatics than do other industries,
245 such as banking, communications and transportation. This is thought by many to be due
246 to a lack of incentive under fee for service medicine to invest in money saving
247 informatics. In addition, there has been a strongly held belief on the part of clinicians
248 that healthcare delivery is not a "business" and cannot be managed as such (note:
249 managed care directly challenges this assumption which is one likely reason why it is so
250 controversial). In any event, the healthcare informatics business is just now in the
251 process of converting from mainframe/minicomputer – terminal technology to client-
252 server. Industry groups such as Microsoft's Healthcare Users Group (HUG) have grown
253 in response to this trend.

254

255 While informatics has long supported the financial and administrative sides of healthcare,
256 it is only recently that it has looked toward supporting the clinician. Electronic patient
257 monitoring and imaging equipment has been around since the 1960's, but until the 1990's
258 each such piece of equipment was an island unto itself. Physicians typically never
259 touched these machines; specially trained technologists operated them and produced
260 hardcopy for the physician to diagnose from. The medical imaging business responded to

261 a call for interoperability in the mid-1980's with the ACR-NEMA standard, but it took
262 over ten years for this to evolve to the present DICOM standard. DICOM, even more so
263 than HL-7, supports interfacing various pieces of imaging equipment, but interoperability
264 remains an elusive goal. Clinical monitoring equipment has likewise achieved cross-
265 vendor connectivity (i.e. with the Medical Information Bus – MIB – standard), but not
266 true interoperability.

267

268 As we move toward the year 2000, we find that healthcare institutions (the IDS', in
269 particular) have suddenly developed a strong need for affordable, interoperable
270 information systems. These systems must operate seamlessly across a wide variety of
271 institutions – pharmacies, laboratories, physician practices of all sizes, outpatient clinics,
272 community hospitals, and tertiary/quaternary care regional medical centers. Furthermore,
273 the MCO model means that participating institutions need to interoperate by sharing their
274 information; but as individual business entities, each institution in an IDS must maintain
275 ownership of their important patient-centered records. Centralized systems cannot meet
276 these needs. Neither can client-server systems (which, themselves, are centralized data
277 storage systems with local data analysis and presentation capabilities). *However,*
278 *distributed object technology would seem ideal for this purpose.* The object oriented
279 (OO) principle of encapsulation is ideal for the protection of data ownership while
280 allowing controlled access to the information by external clients. Distributed object
281 technology (such as CORBA) allows healthcare related objects to communicate over a
282 network; in particular, across physical computer boundaries. CORBA, specifically, as a
283 platform and language independent standard for distributed object technology, seems to
284 offer the best migration path from the current tower of babel to interoperable IDS's.

285

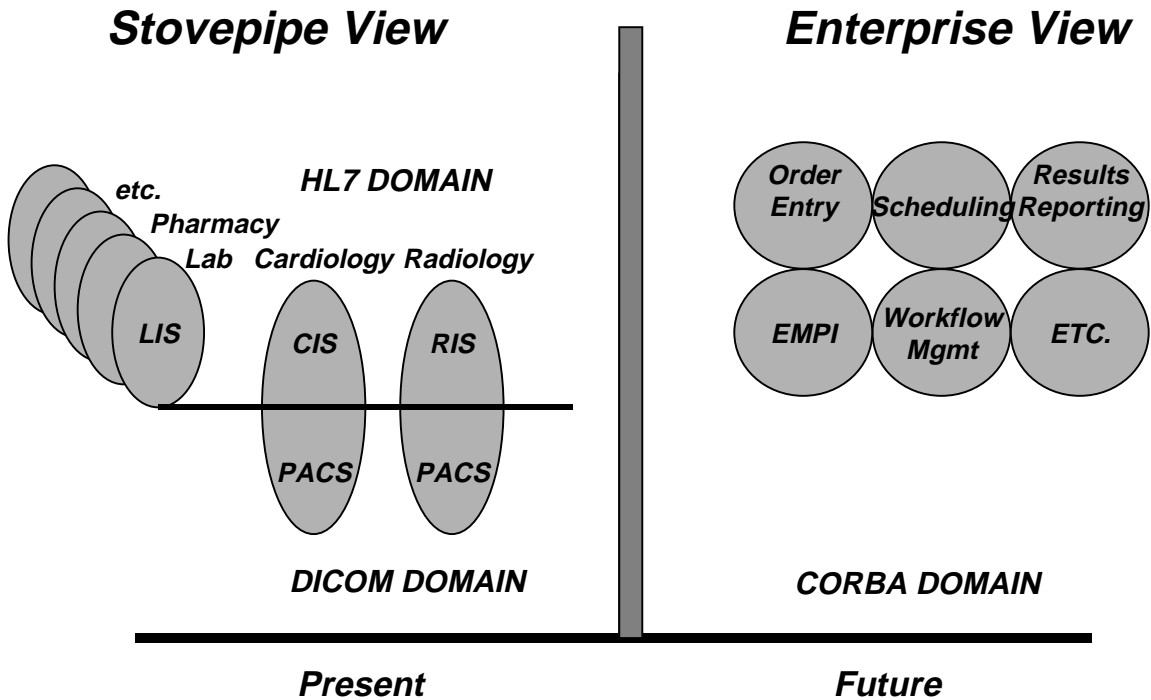

286 **2.2. The Distributed Object World In Healthcare.**

287

288 The last section presented a brief history of healthcare informatics and stated a case for
289 distributed object technology in healthcare in terms of encapsulation and platform
290 independence. Section 2 demonstrated that the trend toward managed care is forcing
291 healthcare to look at itself as a business, and to behave as such. If this trend continues
292 (and there is no reason to believe that it will not), then the other important OO attributes
293 of inheritance and polymorphism should support a major paradigm shift in healthcare
294 informatics; that is, the trend way from “vertically oriented” departmental systems toward
295 “horizontally oriented” business objects. This concept is depicted in figure 4.1.

296

297

298

299

300 *Figure 4.1 The changing paradigm of Healthcare Informatics.*

301

302 Instead of viewing the IDS as radiology, cardiology, laboratory, etc., the object oriented
 303 view is of common services, e.g.: order entry, enterprise scheduling, results reporting,
 304 etc. These services have many operations (methods) in common across the clinical
 305 departments. If they are created on an enterprise basis, they can be subclassed to meet
 306 any detailed needs or nuances of specific clinical departments. The feeling here is that a
 307 lot of duplicated functionality (in operations, staffing and software) could be eliminated
 308 with this approach.

309

310 The cost and quality of healthcare software can be improved by inheriting characteristics
 311 which are common to other businesses. Most businesses involve persons and/or
 312 institutions which interact in the following ways:

313

- 314 • Ordering
- 315 • Tracking (workflow)
- 316 • Scheduling
- 317 • Delivery of goods/services (order fulfillment)
- 318 • Billing
- 319 • Inventory
- 320 • Personnel administration
- 321 • Common services (security, timekeeping, persistence, vocabulary, etc.)

322

323 It should therefore be possible to build a top-level model of the healthcare domain that
324 inherits from these general business functions and objects:
325

- 326 • Persons(PIDS service):
 - 327 • Patients
 - 328 • Guardians/guarantor
 - 329 • Physicians
 - 330 • Nurses
 - 331 • Technologists
 - 332 • Therapists
 - 333 • Pharmacists
 - 334 • Clerical Personnel
 - 335 • Administrative personnel
 - 336 • Maintenance personnel
 - 337 • Etc.
 - 338 • Institutions:
 - 339 • Hospital
 - 340 • Clinic
 - 341 • Office practice
 - 342 • Laboratory
 - 343 • Pharmacy
 - 344 • Etc.
 - 345 • Ordering
 - 346 • Clinical Orders (medications, diagnostic procedures, therapeutic procedures)
 - 347 • *Pharmacy*
 - 348 • Event orders (ADT)
 - 349 • Tracking
 - 350 • Enterprise (patient tracking)
 - 351 • Departmental (workflow tracking)
 - 352 • *CORBA Workflow Management Facility*
 - 353 • Scheduling
 - 354 • Enterprise
 - 355 • Departmental
 - 356 • Delivery of goods/services (order fulfillment)
 - 357 • *Clinical Observations/Results Reporting*
 - 358 • *CORBAlex (vocabulary service)*
 - 359 • *Clinical Decision Support*
 - 360 • Etc.
 - 361 • *Healthcare Financial Services*
 - 362 • *Healthcare Security Framework*
- 363

364 The italicized items in the above “inheritance model” indicate where current CORBAMED
365 activities can fit.

366

367 It is important to note that the transition from a legacy department- based information
368 environment to an enterprise-wide distributed object environment cannot realistically
369 take place in one shot. There are far too many legacy systems which support essential
370 functions within the healthcare delivery system today. Therefore, CORBAMED should
371 adopt a solution which allows CORBA specifications to support implementations that
372 bridge between message-based legacy systems and interoperable CORBA components.

373

374 **3.0 REQUIREMENTS ELABORATION**

375

376 *[Editor's note: The description of the RFIs should be re-written perhaps by the group*
377 *leader that produced the RFI. We need to capture/request information about its*
378 *Relevance to Architectural Vision. The current descriptions are directly from the*
379 *RFPs, perhaps a summary of the responses is appropriate.]*

380 **3.1. Introduction**

381

382 The purpose of this focus activity is to acquire more detailed requirements. This effort is
383 vital to the group's comprehension of industry needs and is crucial in aligning OMG
384 specification development with healthcare requirements. The request for discovering
385 requirements in a particular area is primarily based on an interest and participation by an
386 OMG member.

387

388 **3.2. Explanation of the OMG RFI Process**

389

390 Requirements Elaboration activities are achieved primarily through the issuance of
391 Requests for Information (RFIs). The OMG RFI process does not directly lead to
392 technology adoption. RFIs are used by task forces to solicit general information from the
393 industry. Both OMG members and non-members can respond. Submissions may include
394 information about relevant technologies, products, standards, research, requirements, and
395 other guidance for the task force.

396

397 RFIs are recommended by CORBAmed to the Architecture Board (AB) and Domain
398 Technical Committee (DTC) for issuance. RFIs are usually created whenever
399 information is needed by the task force or a collaborating group to solicit information
400 about industry requirements. In some cases, CORBAmed will issue an RFI in order to
401 define industry requirements for key OMG technology and to help locate potential
402 technology sources for fast track adoption.

403

404 There are no restrictions on who may receive or respond to a RFI. RFI responses are
405 evaluated by members of the CORBAmed and are used to guide the group's activities.
406 Restrictions are placed on the voting process, however. A DTC member must be at least
407 at the Domain Contributing Member (DCM) level in order to vote for issuance of a RFI.

408

409 The following timetable shows a typical schedule of events for a CORBAmed RFI. The
410 duration is approximate. An exact schedule (with specific dates) is established for each
411 RFI.

412

Day	Event / Activity	Duration
	RFI review (“Three week rule”)	21 days
	Vote by CORBAmed to issue RFI	
0	Vote by AB and DTC to issue RFI	
	Preparation of submissions	120 days
120	Submissions due	
	Review of RFI responses by CORBAmed	30 days
150	Evaluation report by CORBAmed	

413
414
415

TABLE 1. TYPICAL RFI PROCESS TIMETABLE

416 3.3. Specific Work Items

417

418 Work items of a general nature identified within this focus activity include:

419

- 420 • issue Requests for Information (RFIs) on requirements / solicit vendors
- 421 • survey available, existing healthcare architectures (via RFIs) for purpose of
- 422 identifying candidates for standardization, positioning the group to ask rather than
- 423 define healthcare frameworks
- 424 • issue white papers addressing healthcare topics

425 3.4. Deliverables

426

427 Anticipated deliverables produced by this focus activity include:

428

- 429 • white papers
- 430 • RFIs
- 431 • RFI responses
- 432 • RFPs
- 433 • Statement of Requirements (is this the same thing as what goes out in the RFP or
- 434 something more?)
- 435 • updated architectural model
- 436 • updated roadmap

437 3.5. Planned Work Items

438 3.5.1. RFI 1

439 Summary

440

441 CORBAmed RFI 1 was issued to solicit information about requirements, projects, and
442 products that would provide guidance for healthcare related object system
443 interoperability. The Object Management Group (OMG) CORBAmed Domain Task
444 Force will use this information to begin the technology adoption process for OMG-
445 compliant interfaces for systems used in healthcare delivery. This RFI seeks information
446 to help CORBAmed make useful and efficient decisions in the healthcare technology
447 adoption process.

448

449 CORBAmed RFI 1 can be found on the OMG web server as document #:

450 **corbamed/96-01-01: CORBAmed RFI**

451

452 Responses to CORBAmed RFI 1 are as follows:

453 **corbamed/96-04-01: IBM Health Solution Unit RFI response**

454 **corbamed/96-05-01: HL7 IMSIG Response to CORBAmed RFI**

455 **corbamed/96-05-02: HealthMagic CORBAmed RFI response**

456 **corbamed/96-05-03: University of Magdeburg RFI response**

457 **corbamed/96-05-04: RFI response from SHINE**

458 **corbamed/96-05-05: RFI response from RICHE**

459 **corbamed/96-05-06: Protocol Systems RFI response**

460 **corbamed/96-05-07: CORBAmed RFI response from Andersen Consulting**

461 **corbamed/96-05-08: University of Wales, Aberystwyth RFI response**

462 **corbamed/96-05-09: Benchmarking Partners RFI response**

463 **corbamed/96-05-10: Hewlett-Packard RFI response**

464 **corbamed/96-05-11: Health Data Sciences Corp. RFI response**

465 **corbamed/96-05-12: Los Alamos National Laboratory RFI response**

466 **corbamed/96-05-13: NHS RFI response**

467 **corbamed/96-05-14: Koop Foundation RFI response**

468 **corbamed/96-05-15: Kurzweil AI RFI response**

469

470 **3.5.2. RFI 2: Clinical Observations**

471 **Summary**

472 CORBAmed RFI 2 was issued to solicit information about requirements that would
473 provide guidance to the CORBAmed Domain Task Force (DTF) of the Object
474 Management Group (OMG) in developing specifications for healthcare information
475 systems dealing with patient observation data. The overall goal will be to adopt vendor-
476 neutral common interfaces that may improve the quality of care and reduce costs by
477 utilizing CORBA technologies for interoperability between systems, applications, and
478 instruments that detect, transmit, store, and display medical information dealing with
479 observations of a particular patient's medical condition. CORBAmed DTF will utilize
480 the OMG's open technology adoption process to standardize interfaces for these
481 healthcare objects.

482

483 CORBAmed RFI 2 can be found on the OMG web server as document #:

484 **corbamed/97-05-02: Clinical Observations RFI**

485

486 Responses to RFI 2 are as follows:

508

509 **3.5.3. RFI 3: Clinical Decision Support**

510 **Summary**

511 This Request for Information (RFI) solicits information about requirements that will
512 provide guidance to the CORBAmed Domain Task Force (DTF) of the Object
513 Management Group (OMG) in developing specifications for clinical Decision Support
514 Systems (DSS). The overall goal will be to adopt vendor-neutral common interfaces that
515 may improve the quality of care and reduce costs by utilizing CORBA technologies for
516 interoperability between systems, applications, and instruments that detect, transmit,
517 store, and display medical information used in clinical DSS. The CORBAmed DTF will
518 utilize the OMG's open technology adoption process to standardize interfaces for these
519 healthcare objects.

520

521

522 The complete CORBAmed RFI 3 can be found on the OMG web server as document #:

534

535

536

537 **3.5.4. RFI 4a: CORBA and HL7 - Approaches and Considerations**

538 **Summary**

539 This Request for Information (RFI) solicits information about requirements that will
540 provide guidance to the CORBAmed Domain Task Force (DTF) of the Object
541 Management Group (OMG) in the area of CORBA based HL7 implementation
542 approaches. The overall goal of CORBAmed is to adopt vendor-neutral common
543 interfaces that may improve the quality of care and reduce costs. CORBAmed DTF will
544 utilize the OMG's open technology adoption process to standardize interfaces in the
545 healthcare arena.

546

547 In the area of HL7 as a standard messaging approach, CORBAmed has established a
548 liaison relationship with the HL7 standards group. One of the primary reasons for this
549 liaison is the desire on the part of CORBAmed to not 'recreate the wheel'. CORBAmed
550 desires to leverage the HL7 reference information model, other HL7 based initiatives, and
551 other standards that help support healthcare communications. As part of that relationship,
552 CORBAmed is attempting to assist HL7 by providing technical analyses regarding
553 implementation approaches, and how to best take advantage of the capabilities inherent in
554 the CORBA distributed object technology framework. We believe that there are a number
555 of possible technical approaches that can be utilized, but are uncertain as to the most
556 optimal approach. Several approaches have been defined already within HL7, through
557 the SIGOBT. There are, we believe, a number of other organizations who have begun to
558 implement CORBA based solutions, who are also using HL7 messages as the semantic
559 backdrop to their implementations.

560

561 The complete CORBAmed RFI 4a can be found on the OMG web server as document:

562 **corbamed/97-09-15: HL7 RFI**

563

564 Responses to RFI 4a are as follows:

565 **corbamed/98-01-04: HBO & Company Response to the HL7 RFI**

566 **corbamed/98-01-05: Hewlett-Packard Response to the HL7 RFI**

567

568 **3.5.5. RFI 4b: Lifesciences RFI**

569 **Summary**

570 This Request for Information (RFI) solicits information about requirements, projects, and
571 products that will provide guidance for life sciences research related object system
572 interoperability. The Object Management Group (OMG) and, specifically, the Life
573 Sciences Research Domain Special Interest Group (LSR-DSIG), will use this information
574 to begin the technology adoption process for OMG-compliant interfaces for systems used
575 in life sciences research. The mission of the Life Sciences Research DSIG is:

576

577 • To improve the quality and utility of software and information systems used in Life
578 Sciences Research through use of the Common Object Request Broker Architecture
579 (CORBA) and the Object Management Architecture (OMA).

580 • To encourage the development of interoperable software tools and services in Life
581 Sciences Research.

582 • To prepare to use the Object Management Group (OMG) technology adoption
583 process to standardize interfaces for software tools, services, frameworks, and
584 components in Life Sciences Research.

585 • To communicate the requirements of the Life Sciences Research domain to the
586 Platform Technical Committee.

587 • To coordinate with OMG Task Forces and Special Interest Groups, and other
588 standards organizations and information providers to ensure common standards.

589

590 The OMG encourages users, consultants, systems integrators, and developers of life
591 sciences research related devices, instruments, applications, databases, and systems to
592 become involved with this process by responding to this RFI. OMG members and non-
593 members may submit responses. Current compliance with OMG specifications is not a
594 prerequisite for response to this RFI. The RFI response can consist of pre-existing
595 product documentation, but should preferably be organized and presented in accordance
596 with this RFI.

597

598 *NOTE: According to OMG rules, SIGs may not issue RFIs. Therefore, this RFI is being*
599 *issued by the CORBAmed Task Force on behalf of the Life Sciences Research DSIG.*

600 *Responses to this RFI will be reviewed by LSR-DSIG.*

601

602 The complete CORBAmed RFI 4b can be found on the OMG web server as document:

603 **corbamed/97-09-16: Life Science Research RFI (CORBAmed RFI4)**

641

642 *The description of the RFP should perhaps also include one or more use-cases,*
643 *representing the main business process the service supports.]*

644 **4.1. Introduction**

645

646 The purpose of this focus activity is to foster the adoption of standard object interfaces
647 for healthcare domain components. These standard object interfaces will be developed
648 through the group's adherence to OMG convention. That is, the issuance of Requests for
649 Proposal (RFP), the evaluation of proposed solutions to the RFP, and the evolution of a
650 related specification.

651

652 This focus activity embraces the primary purpose for the group's existence.

653 **4.2. Explanation of the OMG RFC and RFP Process**

654

655 Specification Development activities include the issuance of Requests for Proposal,
656 evaluation of RFP responses and evaluation of Requests for Comment. Each is discussed
657 below.

658

659 **4.2.1. OMG Request for Proposal Process**

660

661 The OMG Request for Proposal (RFP) process entails a solicitation for technology
662 proposals, followed by revision, evaluation, selection, and approval processes.
663 CORBAMED evaluates the RFP submissions and revised submissions. CORBAMED then
664 selects specifications (by vote of members who are at least at the Influencing or
665 Government Member level) which it recommends to the DTC and AB. OMG members
666 who are at least at the Domain Contributing Member (DCM) level then vote to
667 recommend adoption. The Architecture Board (AB) review normally precedes the DTC
668 vote. The final step is to forward the proposal to the OMG Board of Directors (BoD) for

669 final approval. Adopted specifications are then available for use by OMG members and
670 non-members alike.

671

672 Following the conventions established by the other OMG task forces, CORBAMED will
673 use a three step process for handling submissions. This process can be altered by
674 consensus of CORBAMED.

675

676 *4.2.1.1. Submissions*

677

678 OMG members who are at the least at the DCM level can submit a proposed specification
679 in response to an RFP. Submitters must send a Letter of Intent (LOI) to the OMG
680 declaring their commitment to commercialize the technology. If an organization is not at
681 the DCM level, they may upgrade their membership to either DCM (or Contributing
682 Member) prior to submission. Groups of DCM and/or Platform Contributing Members
683 may submit in teams, representing multi-vendor alliances and external consensus. Other
684 organizations, which are not co-submitters, may be identified in the proposal as
685 supporters of a technology.

686

687 The RFP will establish a submission deadline for the full technology specifications.

688

689 *4.2.1.2. Revised Submissions*

690

691 There will be a subsequent deadline for revised submissions. This revision process
692 encourages mergers of submissions. An organization must have submitted an initial
693 submission in order to participate in a revised submission. For revised submissions, a
694 date by which a working implementation will exist is required.

695

696 *4.2.1.3. Specification Selection*

697

698 After revised submissions are received, the CORBAMED will select (through evaluation)
699 a single specification for each RFP item. Specifications may be conditionally accepted
700 subject to minor changes to be made by the submitter. In most cases, the CORBAMED
701 will establish a revision process to improve specifications in terms of clarity or
702 correctness. Major changes to selected specifications will only take place during a later
703 RFP or RFC-driven enhancement cycle.

704

705 A specification selected by CORBAMED is then endorsed by the Architecture Board,
706 Domain Technical Committee and Board of Directors.

707

708 The CORBAMED RFP process will typically follow the timetable shown below:

709

Day	Event / Activity	Duration
	RFP Review (“Three week rule”)	21 days
	Vote by CORBAMED to issue RFP	

0	AB and DTC votes to issue RFP	
	Preparation of submissions	120 days
60	LOI to submit to RFP due	
90	Voting registration for CORBAmed members closed	
120	Submissions due	
	Preliminary evaluations by CORBAmed and preparation of revised submissions	120 days
240	Revised submissions due	
	Specification selection by CORBAmed	60 days
300	CORBAmed votes to select specifications	
	Review by AB and DTC (“Three week rule”)	21 days
	AB and DTC votes to recommend specification	
	BoD review	
360	BoD votes on specification adoption	

710

711 **TABLE 3. TYPICAL RFP PROCESS TIMETABLE**

712

713

714 Please note that duration noted above is approximate. The exact schedule (with specific
715 dates) for each RFP will be established on an RFP-by-RFP basis and documented in the
716 RFPs.

717

718 **4.2.2. OMG Request for Comment Process**

719

720 The OMG Request for Comment (RFC) process is a fast track adoption process that uses
721 an industry comment period. The RFC process includes the following steps:

722

723 The OMG RFC process starts with an unsolicited technology proposal submitted by one
724 or more OMG members who are at least at the Domain Contributing Member (DCM)
725 level to the CORBAmed. If an organization is not at the DCM level, they may upgrade
726 their membership to DCM (or Contributing Member) at any time prior to submission.

727

728 A presentation and vote on the RFC can be scheduled for a particular CORBAmed
729 meeting by one of the CORBAmed co-chairs. The technology proposal should be
730 available to CORBAmed members three weeks prior to this meeting. At the meeting, the
731 role of the submitters is to convince the CORBAmed to recommend the proposal
732 for OMG review. A CORBAmed member must be at least at the Influencing or
733 Government Member level in order to vote.

734

735 After the CORBAmed recommendation, the Architecture Board and Domain Technical
736 Committee votes to release the RFC, starting the public comment period. DTC members
737 must be at least at the DCM level of membership in order to vote.

738

739 The RFC comment period is 90 days. Any OMG member or non-member may comment.
 740 OMG staff can stop the RFC process if they determine that significant negative comment
 741 has been received.

742

743 After the comment period, the AB and DTC vote for technology adoption. A DTC
 744 member must be at least at the DCM level in order to vote.

745

746 The final step is OMG Board of Directors (BoD) approval.

747

748 CORBAmed encourages the use of the RFC process because it consumes fewer resources
 749 than a comparable RFP process. CORBAmed offers the following guidance to potential
 750 submitters:

751

752 The submitters should be confident that the proposal will survive the RFC period without
 753 significant comment.

754 If there is an external industry group that covers the proposal's technology area, it would
 755 be highly desirable if the submission represents an industry consensus from the external
 756 group.

757 The submitters should consider soliciting feedback from CORBAmed prior to
 758 submission. Most potential submitters give a presentation to CORBAmed and
 759 disseminate a pre-submission draft of the specification for review. The early review can
 760 surface potential problem areas. This optional step can greatly enhance the chances of
 761 successful technology adoption.

762

763 The following timetable shows a typical schedule of events for a CORBAmed RFC
 764 process. The duration is approximate. Exact schedules (with specific dates) are
 765 established for each RFC.

766

Day	Event / Activity	Duration
	Formal submission of full specification for review by CORBAmed, AB and DTC (“Three week rule”).	21 days
	Vote by CORBAmed to issue RFC for OMG review	
0	Vote by AB and DTC to release RFC for OMG review	
	Review period – comments from industry	90 days
90	CORBAmed votes to recommend specification	
	AB and DTC votes to recommend specification	
	BoD review	30 days
120	BoD votes on specification adoption	

767

768 **TABLE 4. TYPICAL RFC PROCESS TIMETABLE**

769 **4.3. Specific Work Items**

770

771 Work items identified within this focus activity include:

772

- 773 • issue RFPs
- 774 • evaluate responses to RFPs
- 775 • make recommendations for adoption - specification development
- 776 • follow-up with RFPs that subsume integration frameworks and address domains
- 777 • evaluation of RFCs

778 **4.4. Deliverables**

779

780 Anticipated deliverables produced by this focus activity include:

781

- 782 • RFPs
- 783 • RFP responses
- 784 • recommendations to DTC

785 **4.5. Planned Work Items**

786

787 The principal work items in this focus activity are related to the issuance and evaluation
788 of RFPs.

789

790 **4.5.1. RFP 1: Patient Identification Services (PIDS)**

791 **Summary**

792 Through out an individual's lifetime they may have episodes of care provided by
793 hundreds of healthcare providing organizations (e.g. hospitals, medical centers, Dr.
794 offices, etc.). These organizations maintain medical records for the patients they have
795 cared for. When a patient comes into a healthcare organization for care there is a need to
796 find the records for any previous care that patient had with the institution. Each
797 healthcare provider may have used a different scheme (e.g. numbering system) to identify
798 the patient. The system used for identifying a patient is called a Master Patient Index
799 (MPI).

800

801 In addition it is desirable to combine the medical records from multiple institutions in
802 order to show a complete picture of a person's health record. This need to combine
803 records from different organizations has increased dramatically in the last few years due
804 to consolidations and collaborations between providers.

805

806 Because of the rapid change in the healthcare environment within the last few years the
807 systems and standards needed to satisfy this need to share patient records do not yet exist.
808 One of the major impediments to this sharing of patient records between organizations is

809 a lack in the ability to identify a patient in a consistent manner. Due to this inability there
810 is no standard way today to combine a patient's records from multiple institutions.

811

812 This RFP solicits proposals for specifications for the common features of a patient
813 identification system that allows multiple of these patient identification systems to
814 interoperate.

815

816 The complete CORBAmed RFP 1 can be found on the OMG web server as document:
817 **corbamed/96-11-02: Patient Identification Service RFP (CORBAmed RFP1)**

818

819 Responses to RFP 1 are as follows:

820 **corbamed/97-05-03: Joint Initial Submission to the CORBAmed RFP1 (PIDS)**

821 **corbamed/97-05-06: Health Data Sciences Corporation's Initial Submission to**
822 **CORBAmed RFP1**

823 **corbamed/97-06-01: Revision 2 of the Joint Submission to the CORBAmed PIDS**
824 **RFP (CORBAmed RFP1)**

825 **corbamed/97-07-03: Joint Initial Submission to the CORBAmed RFP1 (PIDS),**
826 **Revision 3**

827 **corbamed/97-10-03: Joint Initial Submission-Revision 4 to the PIDS RFP**

828 **corbamed/97-11-01: Revised Joint submission to the PIDS RFP**

829 **corbamed/98-01-02: PIDS Final Revised Submission**
830

831 **4.5.2. RFP 2: Lexicon Query Services**

832 **Summary**

833 This RFP solicits proposals for specifications of IDL interfaces for the common features
834 of a set of lexicon query services.

835 This RFP describes the requirement for services to support lexicons (controlled
836 terminology resources) in a distributed object system conforming to the OMA. Despite
837 many efforts over the years, the ability to consistently and precisely represent
838 information, such as observational and historical data in healthcare, has eluded the
839 industry. This ability to represent a concept in an unambiguous machine-readable format
840 is key to the better management of clinical processes within a healthcare organization,
841 and between a healthcare organization and its various trading partners. The ability to
842 support a discrete coded lexicon is of critical importance within the healthcare business
843 segment. It is the first step towards being able to:

844 Better manage the communication of information between disparate organizations

845 Support the collection and analysis of clinical processes and outcomes as a result of
846 consistent and clinically specific encoding

847 Enable the use of sophisticated rule-based 'decision support' tools, which require
848 consistent data representation to be effective. For example, the rule:

849 **If the order is for any drug in the category antibiotics and there is a history of**
850 **allergy to any antibiotic, send an alert regarding possible cross-allergic reactions**

851 requires the ability to classify all antibiotics under a single 'parent' in a specified
852 hierarchy to assure that no matter what drug is ordered, if it is in the category antibiotics,
853 this rule is triggered.

854 Assist in the reporting of information to various interested parties in a consistent manner

855 It is important to make the distinction between the lexicon content (i.e., the
856 “vocabularies” themselves), and the methods to support lexicon queries and functions. In
857 fact, we should not assume that the lexicon query services defined through this effort are
858 necessarily limited to support of a health lexicon/domain of content. It may be the case
859 that these services are a requirement across other domains/task forces within OMG. It is
860 anticipated that responses could be received from vendors who provide similar services
861 outside of the healthcare arena. However, since the primary interest and critical, near
862 term need resides within the healthcare domain, CORBAmed has taken the lead the effort
863 to define these services.

864
865 The complete CORBAmed RFP 2 can be found on the OMG web server as document:
866 **corbamed/97-01-04: Lexicon Query Services RFP**

867
868 Responses to RFP 2 are as follows:
869 **corbamed/97-09-02: Joint Initial Submission to CORBAmed RFP2**

870
871

872 **4.5.3. RFP 3: Pharmacy Interaction Facility (PIF)**

873 **Summary**

874 This RFP solicits proposals for the interface specifications of a Pharmacy Interaction
875 Facility (PIF) that will facilitate the communication of prescription information between
876 pharmacy prescribers and pharmacy dispensers using established healthcare data content
877 as reflected in a variety of publicly-available national and international standards.
878

879 Current trends in public policy involved with government mandated standards for
880 electronic healthcare interactions will influence the requirements for interoperability in

881 healthcare. We will likely see multiple technologies coexisting and interoperating in the
882 future. In particular, future pharmacy interaction systems, based on standards with object-
883 oriented specifications, will likely need to interoperate in some way with systems based
884 on today's character string standards. In addition, pharmacies and physicians will require
885 interoperability to allow communications across many disparate computing platforms.

886

887 The complete CORBAmed RFP 3 can be found on the OMG web server as document:
888 **corbamed/97-12-22: Pharmacy Interaction Facility (PIF) RFP**

889

890 Responses to RFP 3 are as follows:

891 **There are currently no responses to RFP 3**

892

893

894 **4.5.4. RFP 4: Clinical Observations Access Service (COAS)**

895 **Summary**

896 This RFP solicits proposals for accessing clinical observations. Clinical observations
897 constitute a significant proportion of the information recorded about any patient.
898 Examples of clinical observations include the following: laboratory results; vital signs;
899 subjective and objective observations and assessments; observations and measurements
900 provided by a specialist such as radiologist or pathologist who interprets images and
901 other multi-media data. Interoperable specifications that support the activities involved in
902 accessing clinical observations are sought in this RFP. The specifications should leverage
903 existing standards such as HL7 and DICOM .

904

905 The complete CORBAmed RFP 4 can be found on the OMG web server as document:
906 **corbamed/97-12-28: Clinical Observations Access Service (COAS) RFP**

907

908 Responses to RFP 4 are as follows:

909 **There are currently no responses to RFP 4.**

910

911 **4.6. Candidate Topics for Future RFPs**

912

913 The following lists, derived from topical areas identified in the responses to the
914 CORBAmed's RFI 1 and discussed by the group, identify RFPs that may be issued in the
915 future.

916

917 The "coarse-grain" list of potential RFP categories includes:

918

- 919 • Healthcare Security Framework (currently in draft status as: corbamed/98-01-03:
920 Healthcare Security Framework RFP, DRAFT)

- 921 • Clinical Order Management System
- 922 • Clinical Encounter Management System
- 923 • Clinical Decision Support System
- 924 • Clinical Context Service
- 925 • Distribution and Logistics Systems
- 926 • Business Management Systems
- 927 • Quality Management Systems
- 928 • "M" programming language mapping
- 929 • Integration with OMG workflow specifications
- 930 • Scheduling Applications
- 931
- 932

933 **4.7. Criteria for Selection**

934

935 Specification development will proceed in an order that CORBAmed identifies as
936 meeting critical industry needs and essential to completing the group's architectural
937 model.

938

939 **5.0 Healthcare Domain Architecture Development**

940

941 [Editor's Note: See www.omg.org/omaodp/ for information about a related workshop that
942 was held recently. Also see www.iso.ch:8000/RM-ODP/ for some ISO RM-ODP
943 information.]

944

945 **5.1. Introduction**

946

947 The purpose of this focus activity is to define a reference model for healthcare domain
948 software components. This activity supports the first focus activity, requirements
949 elaboration and will provide a framework for the continuous specification development
950 activity.

951 **5.2. Specific Work Items**

952

953 There is only one work item within this focus activity: model development. Elaboration
954 of the model not only assists the group in its activities but also identifies how the
955 CORBAMED model relates to other OMG activities that relates to extending the OMG
956 object model.

957

958 The Enterprise Viewpoint from the Reference Model – Open Distributed Processing
959 (RM-ODP) has been proposed as a description technique for specifying the domain
960 architectures of the vertical domains, including the CORBAMED Healthcare Reference
961 Model or Domain Architecture. The Enterprise Viewpoint of the RM-ODP describes the
962 focus, purpose, scope and policies of a system.

963

964 However, development of a generalized object-oriented healthcare model is a
965 monumental undertaking for a volunteer group. It is the group's intention to take
966 advantage of technical material included in responses to RFPs to generate this model.
967 The CORBAMED RFP responses would perhaps be required to represent the proposed
968 solutions in other RM-ODP viewpoints, in part utilizing IDL.

969 **5.3. Deliverables**

970

971 The anticipated deliverable produced by this focus activity is a growing Healthcare
972 Reference Model. Future CORBAMED specifications should include viewpoints which
973 contribute to the description of the semantics behind the interface definitions. These
974 models will provide for increased interoperability and will also ensure consistency with
975 other CORBAMED specifications as they will become part of the Healthcare Domain
976 Architecture.

977

978

979 **5.4. Schedule**

980

981 The schedule will be aligned with the adoption of CORBAmed specifications and include
982 a prioritized list of candidate future specifications.

983

Planned Start	Activity	Planned Completion
February, 1998	Issue whitepaper: The RM-ODP Enterprise Viewpoint and the CORBAmed RM	June, 1998
June, 1998	Presentations by RM-OPD and OMA experts on how it relates to the domain of healthcare	June, 1998

984

985

986

TABLE 6. ROADMAP OF HEALTHCARE REFERENCE MODEL DEVELOPMENT

987 **6.0 OMG SUPPORT**

988 **6.1. Introduction**

989

990 The purpose of this focus activity is to ensure consistency and support of healthcare
991 domain requirements with existing and future OMG specifications. It will also be a
992 forum for expressing healthcare requirements to existing and future OMG specifications.
993

994 **6.2. Specific Work Items**

995

996 General work items within this focus activity identified to date include:

997

- 998 • Identify and evaluate appropriate OMG specifications
- 999 • Participation in the Domain Technical Committee (DTC)
- 1000 • Observation of the OMG Architecture Board (AB) activities
- 1001 • Participation in Platform Technical Committee (PTC) task forces

1002

1003 Specific work items include:

1004

- 1005 • Unifying CORBAMED frameworks / interfaces with related OMG activities
- 1006 • Working with the BODTF to develop a unifying OMG domain model
- 1007 • Alignment with workflow specifications
- 1008 • Evaluation of the CORBAsecurity service
- 1009 • Evaluation of the Notification Service

1010

1011 **6.3. Deliverables**

1012

1013 Anticipated deliverable produced by this focus activity include:

1014

- 1015 • Documented conflicts / gaps / overlaps / acceptances
- 1016 • Revisions to OMG DTC (and possibly PTC) specifications
- 1017 • Revisions to healthcare domain specifications

1018

1019 **6.4. Schedule**

1020

1021 This is an ongoing activity; this table attempts to describe some of the current activities.
1022

Planned Start	Activity	Planned Completion
July, 1997	Issue CORBAmed Security Working Group whitepaper	September, 1997
September, 1997	Issue 2 nd CORBAmed Security Working group whitepaper.	December, 1997
March, 1998	Issue whitepaper on proposed Workflow Service	June, 1998
	Issue whitepaper on CBO and healthcare	June, 1998

1023 **Appendix A: Healthcare DTF Three-Year Plan**

1024

1025 This appendix summarizes the Healthcare Domain Task Force activity for the next three
1026 years.

1027

1997	1998	1999
Create the first draft of a roadmap.	Issue the first CORBAMED Roadmap . Expand in terms of Domain Architecture description.	
	Adopt RFP #1 – Patient Identification Service	
	Adopt RFP #2 – Lexicon Query Service.	
Issue RFP #3 – Pharmacy Interaction Facility	Adopt RFP #3 – Pharmacy Interaction Facility	
Issue RFP #4 – Clinical Observation Service	Adopt RFP #4 – Clinical Observation Service	
	Issue RFP #5 – Healthcare Security Framework	Adopt RFP # 5 – Healthcare Security Framework
Issue RFI #2 - Decision Support System	Issue RFP #6-	
	Issue RFP #7 – Clinical Encounter Management	
	Issue RFP #8 – Clinical Order Management	
	Issue Roadmap Paper
